

Reserve Estimation Summary

Barkhola Coal Block, Raniganj Coalfield Extension — Fictional Illustrative Report

Report Reference:	SGMC/RE/2026/0417	Block Code:	BCB-14/RCE
Reporting Date:	14 April 2026	Estimate As-On Date:	31 March 2026
Prepared For:	Internal Resource Planning Cell	Classification:	Internal Use

1. Survey Methodology and Basis of Estimation

The reserve estimate presented in this summary is based on a combined program of exploratory drilling, geophysical logging, and seam correlation carried out across the Barkhola Coal Block between 8 January 2026 and 26 March 2026. A total of 21 exploratory boreholes (14 new boreholes and 7 re-logged legacy boreholes drilled in 2018–2019) were used to establish seam continuity, thickness, depth, and parting characteristics for the three principal workable seams identified in the block (Seam II, Seam III, and Seam IV). Borehole spacing was maintained at approximately 300–450 metres in areas classified as Proved and Indicated, widening to 600–750 metres in peripheral zones classified as Inferred, consistent with the borehole density criteria set out in the national Coal Resource and Reserve classification framework.

Fieldwork and core logging were carried out by the resident survey team of Sagarmatha Geo-Mining Consultants Pvt. Ltd., comprising R. Deshmukh (Team Lead, Senior Mine Geologist), A. Bhattacharya (Exploration Geologist), and S. Fernandes (Surveyor, Geophysical Logging). Seam thickness and specific gravity values used in tonnage computation were derived from core recovery data and laboratory proximate analysis conducted at the divisional coal testing laboratory. Reserve blocks were delineated using the seam-wise polygonal (isopach) method, with density values ranging from 1.42 to 1.51 tonnes per cubic metre depending on seam and ash content.

2. Reserve Summary by Category (as on 31 March 2026)

Table 1 below presents the geological reserves of the Barkhola Coal Block, classified as Proved, Indicated, and Inferred in accordance with the borehole density and confidence criteria described in Section 1. Figures are expressed in million tonnes (Mt).¹

Reserve Category	Seam II	Seam III	Seam IV	Total (Mt)
Proved	18.60	24.10	9.80	52.50
Indicated	12.40	16.75	7.15	36.30
Inferred	6.90	8.20	4.10	19.20
Total Geological Reserve	37.90	49.05	21.05	108.00

The Proved and Indicated categories together (“Measured + Indicated”, 88.80 Mt) account for approximately 82.2% of total geological reserve, reflecting the relatively dense borehole coverage achieved across the central and southern panels of the block during the current campaign.

3. Comparison with Prior Year Estimate

The current estimate supersedes the previous reserve statement for the Barkhola Coal Block, which was prepared as on 31 March 2025 (Report Reference SGMC/RE/2025/0362) using data from 13 boreholes then available. Table 2 compares the two estimates.

Category	31 Mar 2025 (Mt)	31 Mar 2026 (Mt)	Change (Mt)
Proved	46.20	52.50	+6.30
Indicated	33.80	36.30	+2.50
Inferred	22.50	19.20	-3.30
Total	102.50	108.00	+5.50

The net increase of 5.50 Mt in total geological reserve is attributable primarily to upgradation of previously Inferred blocks in the southern panel to Indicated and Proved status following the additional drilling completed in Q1 2026, partially offset by minor downward revision of Seam IV thickness in the north-eastern extension following revised correlation.

4. Remarks

This summary is intended for internal resource planning purposes only and does not constitute a statutory reserve statement. Figures are geological (in-situ) reserves and have not been adjusted for mining losses, dilution, or extraction methodology. A detailed geological report with seam-wise sections, borehole logs, and quality parameters is maintained separately and is available on request from the Mine Geology & Resource Assessment Division.

¹ All reserve figures in this report are stated in million tonnes (Mt), on an as-mined (run-of-mine) geological basis, at in-situ moisture, unless otherwise specified. One million tonnes (Mt) = 1,000,000 tonnes = 10^6 t. Figures are rounded to two decimal places; minor rounding differences between seam-wise and total figures may occur.
